

S6 Fig. Western blot analysis for the degradation of histone by activated protein C

(APC). The human recombinant histone H3.3 (MW 15.5 KDa) was incubated with or without 100 nM APC at RT for 30 min. (A) Then the histone was visualized by anti-human histone antibody. (B) The membrane of western blot was stained with Ponceau S solution. The arrow indicated intact histone H3. Note that the histone band was weakened under APC treatment.
